

## Week 2 – Project 1 – Digital Media Arts 1B

### Basic HTML Website

Use Notepad to create a basic HTML website about the topic below. Use your HTML lessons to help you add lots of cool things to it! Try to be consistent in your design so the site all has the same look. Have fun and pick a topic you are interested in!

**Your Topic:** You can choose skateboarding, a TV show or movie, a video game, or a sports team! Create a basic HTML website that shows off the coding concepts you have been learning in class. Think about how you can copy code to add in some cool concepts.

- Must have an index (home page) that introduces the topic and has links to the entire site.
- Must have a background color other than white on each page.
- Must have links on each page that link to all the other pages in the site (navigation).
- Must have 5 pages in the site.
- Must have text that explains or shows off what is on each page.
- Must have a singular page design that remains constant throughout the adventure (colors, layout, etc).
- Must have at least one image on each page.
- Keep the entire concept of your site school appropriate!

#### Things to Think About:

-Make sure to set up your website folder in your week 2 folder first! Include a documents, images, and originals folder.

-What type of look and design makes sense for you? What colors, concepts should you incorporate that flow with the images you have chosen?

-What content do you need to have? How can you best relay that content to the end user?

#### Examples:
